

User Privileges – Screenshots Explanation

Screenshot 1: Creating data_entry

In this setup, I created a user named data_entry with the password entriypass456. This user was granted **SELECT, INSERT, and UPDATE** privileges on the Members, Bookings, and ClassSchedule tables.

This role is tailored for administrative staff who need to register members, manage bookings, and adjust class timetables while ensuring they cannot delete or alter other system data.

Screenshot 2: Creating admin_user

I then created an admin_user with the password adminpass789. This user has been granted **full permissions** — including DELETE rights — on the Members, Bookings, and Payments tables.

This higher-level access is appropriate for team leads or database administrators who may need to remove records or correct mistakes across core operational areas.

Screenshot 3: FLUSH PRIVILEGES Clarification

Finally, I executed the FLUSH PRIVILEGES command to apply changes. However, this step is actually **unnecessary** when using GRANT or CREATE USER, as MySQL updates privileges automatically in these cases.

While harmless, this command is typically only needed when permissions are manually changed in the mysql.user table.
