

Cooking Recipes Database Project

Project Structure

recipe_project/

- schema.sql : SQL script that creates all tables
- sample_data.sql : SQL script to populate tables with sample data
- recipe_project_queries.sql : SQL queries: insert, update, delete, join, aggregation, subquery
- ERD.png : Entity Relationship Diagram (ERD)
- project_report.md : Formal project report
- README.md : This file
- screenshots/ : Screenshots of executed queries and table contents

Description

The database includes the following main entities:

- Users who create and rate recipes.
- Categories such as "Dessert", "Main Course", etc.
- Recipes each recipe belongs to a user and a category.
- Ingredients items used in recipes.
- Recipe_Ingredients many-to-many table linking ingredients and recipes with quantities.
- Ratings user-submitted feedback on recipes.

Features Demonstrated

- Entity-Relationship modelling
- SQL DDL (CREATE TABLE with primary/foreign keys)
- SQL DML (INSERT, UPDATE, DELETE)
- Filtering with LIKE and WHERE
- JOINS across multiple tables

Cooking Recipes Database Project

- Aggregation (MAX, AVG)
- Subqueries and nested logic

Technologies Used

- MySQL (Workbench)
- SQL scripts written and tested in .sql files
- Screenshot evidence captured from MySQL Workbench GUI

Verification

Each key SQL query and data retrieval was executed and validated through screenshots. All screenshots are included in the screenshots/ folder.
